

ABSTRACT

An apparatus is disclosed including a first device which includes a first stick having a first tip, a second device which includes a second stick having a second tip, and a third device which includes a first hollow tube in which a spring is located. The first and second devices may be connected to the third device so that the first and second sticks can pivot with respect to the third device. In a rest state, the spring causes the first stick to be separated from the second stick so that the first tip and the second tip do not contact each other. The first stick and the second stick can be pressed together into a compressed state, so that the first and second sticks pivot with respect to the third device, the spring is compressed by the first and second devices, and the first and second tips come into contact with each other.
